

Minimum wages

AE318 - Labour Economics

Roland Rathelot

Minimum wages

- ▶ As an “heterodox” policy, economists are not traditionally fond of minimum wages
- ▶ Large literature, both theoretical and empirical to clarify the trade-off faced by policy makers
- ▶ Main effects:
 - ▶ Increases the wage of affected workers (+)
 - ▶ Reduces employment of some workers (–)
- ▶ Additional effects:
 - ▶ Redistributes economic rent from stockholders to workers (+)
 - ▶ Increases output price (increased input cost) which hurts customers (–)

- ▶ Competitive model with 1 labor type: negative effects of a binding minimum wage (Stigler, 1946)
 - ▶ Direct effect: employers substitute capital for labour
 - ▶ Macro loop: increased input cost reduces output and labour demand
- ▶ If 2 labour types
 - ▶ Overall negative labour effect mitigated by unskilled-skilled substitution
 - ▶ Still: employment reduction for unskilled
- ▶ Monopsony: workers' mobility is limited and employers have some power to set wages lower than marginal productivity
 - ▶ Impact of minimum wage ambiguous

A history of (empirical) violence

- ▶ Older papers
 - ▶ 1960s: Didn't find an effect on employment (Lester)
 - ▶ 1970s: found an effect (surveys by Brown and Wellington)
- ▶ Burgeoning literature in the early 1990s, with the emergence of case studies and new data (e.g. Card and Krueger 1994)
- ▶ 1990s-2000s: Still many panel data papers (using diff-in-diff across states and changes of minimum wage rates)
- ▶ Still two sides:
 - ▶ Neumark and Wascher: evidence of a negative effect on employment is overwhelming
 - ▶ Card/Krueger, Dube/Reich....: no evidence for a significant effect

- ▶ Dube, Lester, Reich (2010): diff-in-diff might be flawed
 - ▶ States might have different trends (which could be correlated with minimum wages)
- ▶ Idea: generalise case studies: restrict the analysis to a narrow ribbon around state borders
- ▶ Focus on restaurants and other low-wage sectors (to maximise power)
- ▶ Employment elasticity to minimum wage insignificant and no greater than $-.15$
- ▶ Neumark, Salas and Wascher (2014): nearby states may not be perfect controls
 - ▶ with other control states: elasticity between $-.1$ and $-.2$

Harasztosi and Lindner (2019)

Who Pays for the Minimum Wage? *American Economic Review*. 2019

Péter Harasztosi
Joint Research Center, European
Commission

Attila Lindner
UCL

- ▶ Analyse a very large (60%) minimum-wage increase in Hungary in 2001
- ▶ Results:
 - ▶ Limited effect on employment (elasticity of $-.03$, with a s.e. of $.004$)
 - ▶ Incidence: 80% on the final consumer, 20% on firms owners
 - ▶ Labour-capital substitution going on
 - ▶ Heterogeneity of the employment effect: tradable-sector firms experience larger effect than non-tradable sector ones

The minimum wage reform

Effect on employment and wages

- ▶ Difference in difference at the firm-year level:

$$\frac{y_{it} - y_{i2000}}{y_{i2000}} = \alpha_t + \beta_t FA_i + \gamma_t X_{it} + \varepsilon_{it}$$

with y the employment level, FA the fraction of workers for whom the 2002 min wage is binding

- ▶ They keep in the sample firms that shut down after 2000
 - ▶ Test pre-trends between high- FA and low- FA firms
- ▶ Point estimate of -8% (decrease of employment when FA goes from 0% to 100%)
 - ▶ Elasticity of employment wrt min wage: -.03
 - ▶ Elasticity of employment wrt average wage: -.15
- ▶ Same analysis for wages: 50% increase

Log earnings and bunching

Heterogeneity of the effect on employment

Price and revenue

Balance-sheet components

Back to the neoclassical model

- ▶ Using empirical moments:
 - ▶ Employment elasticity
 - ▶ Revenue elasticity
 - ▶ Materials elasticity
 - ▶ Capital elasticity
 - ▶ Price elasticity
- ▶ they estimate structural parameters for several sectors
 - ▶ output demand
 - ▶ capital-labour elasticity
 - ▶ material-labour elasticity

The effect of minimum wages on the total number of jobs: Evidence from the United States using a bunching estimator, 2017

- ▶ Back to the US: use variation in state minimum wages between 1979 and 2016
- ▶ Bunching estimates: compare the number of missing jobs paying below the new minimum during the five years following implementation to the excess number of jobs paying just above minimum
- ▶ Rule out minimum wage elasticities of total employment below -0.06

Minimum Wages and Firm Profitability, American Economic Journal: Applied Economics, 2011

- ▶ Use the introduction of a national minimum wage in the UK in 1999
- ▶ Same empirical strategy as Harasztosi and Lindner (2017)
- ▶ Test a simple model in which firms do not react
 - ▶ Minimum wages increase labour cost and reduce profits

$$\Delta \left(\frac{\Pi}{S} \right) = - \left(\frac{WL}{S} \right) \left(\frac{\Delta W}{W} \right)$$

	Period before and after NMW introduction, 1997–2002 ($N = 4,112$)	
	Change in $\ln(\text{average wage}), \Delta \ln W$	Change in gross profit margin, $\Delta(\Pi/S)$
<i>Panel A. Treatment = low-wage firm</i>		
Pre-NMW low wage firm	0.090*** (0.026)	−0.029** (0.012)
Test of no behavioral response	$p\text{-value} = 0.663$	
<i>Panel B. Treatment = $-\text{pre-policy } \ln(W)$</i>		
– Pre-NMW $\ln(W)$	0.188*** (0.033)	−0.032** (0.015)
Test of no behavioral response	$p\text{-value} = 0.144$	

Minimum wages... in China

- ▶ Fang and Lin (2015)
 - ▶ Look at the impact of minimum wage changes (across counties and years) over the 2002-09 period
 - ▶ Find significant adverse impact on employment
- ▶ Dautovic, Hau, Huang (2017)
 - ▶ Investigate the impact on consumption over the same period, with a similar strategy
 - ▶ Find an 1:1 increase in consumption
 - ▶ Do not confirm the adverse impact on employment

Minimum wages... in China

- ▶ Mayneris, Poncet and Zhang (2014)
 - ▶ Study how the 2004 reform of minimum wage rules in China has affected the survival, average wage, employment and productivity of local firms
 - ▶ For surviving firms, wage costs increased without negative repercussions on employment
 - ▶ Minimum wage growth allows more productive firms to replace the least productive ones and forces incumbent firms to strengthen their competitiveness, these two mechanisms boosting the aggregate efficiency of the economy

Derenoncourt and Montialoux (2021)

Minimum Wages and Racial Inequality. *Quarterly Journal of Economics*. 2021

Ellora Derenoncourt
Princeton

Claire Montialoux
Sciences Po

What are the main determinants of the decline?

- ▶ Many hypotheses already around in the literature
- ▶ New hypothesis: the extension of the federal minimum wage to new industries
- ▶ Fair Labor Standard Act of 1966: introduces federal min wage to uncovered sectors: agriculture, hotels, restaurants, schools, hospitals, entertainment, other services
- ▶ Black workers tended to be over-represented in these industries (20% of the overall workers, and a third of black workers)
- ▶ Paper assembles new dataset on hourly wages by industry, occupation, gender, and region between the 1960s and the 1980s (digitalising paper reports from the Bureau of Labor Statistics)

(B) By type of industry

1. The 1967 reform had a large effect on wages for workers at the bottom of the earnings distribution
 - ▶ annual earnings of workers working in 1967 jumps 5.3% compared to those working in previously covered industries (CPS)
 - ▶ 16% of workers are impacted and receive a 34% wage increase on average (BLS)

1. The 1967 reform had a large effect on wages for workers at the bottom of the earnings distribution
2. The 1967 reform had a limited effect on employment
 - ▶ DiD (using states that has a higher min wage in 1966) employment elasticities wrt average wage greater than -0.16 can be ruled out
 - ▶ Bunching estimates confirm this conclusion

FIGURE VII
States with No Minimum Wage Laws as of January 1966

(A) Impact on annual number of hours worked (intensive margin)

(B) Impact on probability of being employed (vs. unemployed) (extensive margin)

(A) Case study: laundries in the South

1. The 1967 reform had a large effect on wages for workers at the bottom of the earnings distribution
2. The 1967 reform had a limited effect on employment
3. The 1967 reform can account for about 20% of the decline in racial gaps
 - ▶ Counterfactual computing by assuming that, absent the reform wages in the impacted industries would have evolved in parallel to that of the control group
 - ▶ Considering adjusted racial earnings gap (gender, education, experience, hours and weeks worked, occupation, marital status), racial gap is down to zero

(B) Adjusted racial earnings gaps, by treatment status
